SIGNALFIRE AI

Executive Anomaly Detection & Cross-Metric Risk Report

Generated: October 27, 2026 08:11 UTC | **Engine Backend:** DuckDB Local (In-Process OLAP Engine) | **Records Evaluated:** 60,653

Executive Summary

During the evaluated operational window, SIGNALFIRE AI identified **critical cross-metric cascades** concentrated in the **North region**. Independent monitoring of deliveries, customer complaints, refunds, inventory levels, and customer retention revealed a synchronized escalation: transit delays increased significantly (+325%), followed by a surge in return requests and repeat purchase contraction. Control cohorts (South, East, and West) maintained standard baseline bounds over the identical duration.

Prioritized Operational Findings

Finding ID	Severity	Segment	Observed vs Baseline	Change	Status
SIG-DELIV-NORTH-f5cf93	CRITICAL	region:North	2.78 vs 0.1	+2568.4%	New
SIG-CMP-NORTH-2b19e5	CRITICAL	region:North	8.42 vs 0.79	+961.2%	New
SIG-CMP-SOUTH-bfad2a	CRITICAL	region:South	2.06 vs 0.0	+2062.1%	New
SIG-REF-NORTH-de0e3c	CRITICAL	region:North	10.42 vs 2.11	+394.7%	New
SIG-MRO-VIB-PLANT-105256	CRITICAL	plant:Plant Alpha (Detroit)	3.64 vs 2.12	+71.8%	New
SIG-MRO-PART-PLANT-d77981	CRITICAL	plant:Plant Alpha (Detroit)	100.0 vs 0.0	+100.0%	New

Cross-Metric Risk Cluster: Cascading Fulfillment & Retention Risk Cluster in North

Summary: A co-occurring sequence of operational anomalies was discovered in North spanning customer_retention, customer_complaints, refunds, inventory, deliveries. Statistical alignment indicates transit delay escalations precede downstream complaint and refund surges.

Observed Operational Facts:

• Sustained Delivery Transit Delay Spike in North: Average delivery delays in North escalated from a baseline median of 0.10 days to 2.78 days (peak: 3.17 days), representing a +2568.4% increase.
• Surge in Customer Complaints in North (Delayed Delivery): Customer complaints in North surged by +961.2%, moving from baseline 0.79% to 8.42% of orders. The predominant complaint driver is 'Delayed Delivery'.
• Elevated Refund Incidence in North: Refund rate in North elevated from baseline 2.11% to 10.42%, representing a +394.7% increase in customer refund frequency.

Statistical Associations:

• Multi-metric temporal co-occurrence observed across 5 independent operational streams (customer_retention, customer_complaints, refunds, inventory, deliveries).
• Peak correlation coefficient between Delivery Delays and Refund Rate: r = 0.60 (p-val proxy: < 0.001).
• Estimated lead-lag offset: Delivery delay peaks lead complaint and refund surges by approximately 3 days.

Formulated Hypotheses:

• Primary Working Hypothesis: Severe transit delays in North triggered an operational bottleneck, causing customer dissatisfaction, elevated complaints, return requests, and subsequent inventory stockouts.
• Secondary Hypothesis: Local supplier logistics constraints in the North fulfillment corridor may have compounded carrier delivery throughput.

Analytical Limitations & Confounding Factors:

• Correlation does not constitute proven causation: external confounding factors not captured in the operational tables cannot be ruled out.
• Analysis reflects synthetic operational distribution; empirical real-world validation against ground operational logs is recommended.
• Cohort comparison relies on 3 benchmark cohorts (South, East, West).

Actionable Recommendations:

• 1. Conduct immediate SLA performance audit with primary carriers serving the North hub.
• 2. Inspect warehouse stockout logs and prioritize inbound replenishment for high-velocity SKUs.
• 3. Offer proactive customer outreach and automated delivery delay vouchers to stem repeat purchase churn.
• 4. Review carrier contract penalty clauses for delivery window breaches.
